

NOAH • SIGNAL PHYSICS

Why Noah Is *Different*

Measuring the forces behind a decision — before forming an opinion.

NARRATIVE SIGNAL • FORCE MEASUREMENT • RECONCILED CONVICTION

01 THE QUESTION

A trader asks: *"Should I buy BP?"*

At first glance this sounds simple. In reality it is a combination of competing forces:

The challenge is not finding information.

*The challenge is **measuring which forces matter most.***

02 HOW MOST AI SYSTEMS APPROACH THE PROBLEM

Question

Search web

Retrieve articles

Read articles

Generate summary

Produce opinion

"BP looks reasonably attractive because..."

STRENGTHS

- ✓ Fast
- ✓ Impressive
- ✓ Better than traditional search

LIMITATIONS

- ✗ No measurement layer
- ✗ No explicit contradiction testing
- ✗ Hard to explain why the answer changed
- ✗ Hard to compare month-on-month
- ✗ Confidence reflects language, not evidence

The answer is ultimately **an opinion generated from retrieved information.**

03 HOW NOAH APPROACHES THE SAME PROBLEM

Between measurement and reconciliation, Noah quantifies each force along four dimensions:

- Velocity
- Persistence
- Breadth
- Direction

*The narrative is the **final stage**, not the analysis.*

04 WHAT ACTUALLY HAPPENED IN THE BP EXAMPLE

Noah created multiple investigative lanes — *each measured separately* before any conclusion.

POSITIVE FORCES

- Capital returns
- Dividend sustainability
- Buybacks
- Operational delivery
- Analyst upgrades

NEGATIVE FORCES

- Regulatory pressure
- Litigation
- Windfall taxes
- Oil-price sensitivity
- Sector headwinds

05 WHAT CREATES CONVICTION?

High conviction

ALIGNED

All major forces point in the same direction.

- Strong operations
- +
- Strong analyst support
- +
- Strong market backdrop
- +
- No regulatory pressure

↘ High conviction outcome

Low conviction

CONTRADICTORY

Positive and negative forces both exist.

- Strong dividends
- +
- Strong operations
- BUT
- Weak oil market
- +
- Regulatory pressure

↘ Mixed outcome » Lower conviction

06 WHY BP WAS A HOLD

The company itself looked relatively healthy. However, three forces remained active drags:

- Oil sensitivity remained a drag
- Regulatory pressure remained elevated
- Litigation and tax concerns remained active

Positive forces

Negative forces

HOLD

FORCES LARGELY OFFSET

*Not because Noah was uncertain — because the **measured forces were contradictory.***

07 WHY THIS MATTERS

TRADITIONAL AI TELLS YOU

*"What do we think?"**What is strengthening?**What is accelerating?**What would change the answer?*

NOAH TELLS YOU

*"What forces are acting on the situation?"**What is weakening?**What is contradictory?*

08 MONTH-ON-MONTH TRACKING

Rather than tracking a single score, Noah tracks the **movement of the underlying forces**.

The final score changes because a **specific force moved**. Clients can see **what changed**, **why it changed**, and **which evidence moved it** — rather than simply being told a score increased.

09 THE DIFFERENCE IN ONE SENTENCE

Most AI systems generate an opinion from information.

NOAH

Noah measures the **competing forces acting on a decision** — before generating an opinion.
